

# TelsySpywareDetector

Managed Security Services  
Mobile Security

Smartphones are increasingly susceptible to advanced attacks by malware installed without the owner's knowledge by exploiting unknown operating system vulnerabilities and certain APPs. TelsySpywareDetector, in both Traffic and Device versions, is the solution capable of detecting potential Spyware on mobile devices without the need for installation.

## Monitoring and protection without installation

The complexity of mobile operating systems and the open and difficult-to-control scope of connectivity exposes users to the risk of exfiltration of sensitive data or unauthorised interception by Threat Actors..

### TelsySpywareDetector<sup>Traffic</sup>

Detector capable of offering an ad-hoc WiFi network to which smartphones can connect for network traffic analysis. Exploiting AI and IT feeds, it is possible to assess any suspicious activity and monitor it through a dedicated dashboard.

### TelsySpywareDetector<sup>Device</sup>

It enables an in-depth and automated forensic analysis of all processes, executions and ownership of files on the mobile device, connected by USB cable, without taking any data from the device. A detailed report of any anomalies detected can be consulted via a dedicated dashboard.

## Why TelsySpywareDetector?

- **Short analysis times** Assessment of *suspicious activity*
- **No type of installation** on the device
- **No violation of user privacy**
